

Reasoning for Code Changes

Reasons for the Changes

The changes made to the codebase are primarily driven by the need to adapt to changes in the underlying frameworks and libraries used, specifically for compatibility with Spring Boot 3, Spring Security 5.7+, and Hibernate 6. Here are the key reasons:

- **Migration from javax to jakarta namespace:**
 - The Java EE APIs have been transferred to the Eclipse Foundation, and as a result, the package names have changed from javax to jakarta. This change affects imports related to persistence (`jakarta.persistence`), validation (`jakarta.validation`), and servlets (`jakarta.servlet`).
- **Update for Spring Security 5.7+ and Spring Boot 3 compatibility:**
 - `WebSecurityConfigurerAdapter` has been removed in Spring Security 6, requiring a change to use lambda-based configuration with `SecurityFilterChain`.
 - `@EnableGlobalMethodSecurity` is deprecated in favor of `@EnableMethodSecurity`.
 - The way authentication managers are configured and beans are defined has been updated.
- **Hibernate 6 compatibility:**
 - The `@Type` annotation for specifying custom types has been removed in Hibernate 6. Instead, `@Column` with `columnDefinition` or `@Convert` with a custom converter class should be used.
- **Code Cleanup and Simplification:**
 - Removal of redundant or unused code, such as duplicate fields in `RegisterRequestDto`.
 - Simplification of security configurations to align with best practices and new API methods.

Key Takeaways

- The changes are necessary for maintaining compatibility with the latest versions of Spring Boot, Spring Security, and Hibernate.
- The migration from javax to jakarta namespace is a critical step for projects using Java EE APIs transferred to the Eclipse Foundation.
- Security configurations have been simplified and updated to reflect best practices and changes in the Spring Security API.
