

Reasoning for Code Changes

Rationale for Code Changes

The changes made to the codebase are primarily focused on updating dependencies to ensure compatibility with Spring Boot 3. The key reasons for these modifications are:

- * **Updated import statements for Jakarta EE compatibility:** The `javax` imports have been replaced with `jakarta` to align with the changes introduced in Spring Boot 3, which now uses Jakarta EE instead of Java EE.
- * **Spring Boot 3 compatibility:** The updates are necessary to ensure that the application remains compatible with the latest version of Spring Boot, which has migrated from Java EE to Jakarta EE.
- * **Resolving potential dependency conflicts:** By updating the imports to use `jakarta` instead of `javax`, the changes help prevent potential dependency conflicts that could arise from using outdated Java EE packages.
- * **Future-proofing the codebase:** These updates contribute to future-proofing the codebase by adopting the latest standards and dependencies, making it easier to maintain and update the application over time.
