

Reasoning for Code Changes

Rationale for Code Changes

The following changes were made to ensure compatibility and resolve potential issues:

- * **Replaced javax with jakarta for Spring Boot 3 compatibility:** + Updated import statements in `User.java`, `RegisterRequestDto.java`, and `Book.java` to use `jakarta.persistence` and `jakarta.validation.constraints` instead of `javax.persistence` and `javax.validation.constraints`. + This change is necessary because Spring Boot 3 has migrated from `javax` to `jakarta` packages.
- * **Updated Hibernate annotation for compatibility with Hibernate 6:** + Replaced the deprecated `@Type` annotation with `@Convert` in `Book.java` to specify the converter for the active field. + The `@Type` annotation is no longer accepted in Hibernate 6, and using `@Convert` with a custom converter (e.g., `YesNoConverter.class`) is the recommended approach.
- * **Resolved potential compile errors and vulnerabilities:** + The changes ensure that the code is compatible with the latest versions of Spring Boot and Hibernate, reducing the risk of compile errors and potential security vulnerabilities.
