

Reasoning for Code Changes

Changes for Spring Boot 3 Compatibility

- Replaced `javax` with `jakarta` in import statements to ensure compatibility with Spring Boot 3, which uses Jakarta EE instead of Java EE.
- Updated `WebSecurityConfigurerAdapter` to use `SecurityFilterChain` bean, as `WebSecurityConfigurerAdapter` is removed in Spring Security 6.
- Replaced `@EnableGlobalMethodSecurity` with `@EnableMethodSecurity` to enable method security in Spring Security.
- Updated `configure(HttpSecurity)` to use `authorizeHttpRequests()` instead of `authorizeRequests()`, and `requestMatchers()` instead of `antMatchers()`.
- Removed `configure(WebSecurity)` and replaced it with `WebSecurityCustomizer` bean.
- Updated `configure(AuthenticationManagerBuilder)` to use a different approach, as the old method is removed in Spring Security 6.
- Replaced `authenticationManagerBean()` with `authenticationManager(AuthenticationConfiguration)` to inject `AuthenticationManager` differently.

Changes for Hibernate 6 Compatibility

- Removed `@Type` annotation, which is no longer accepted in Hibernate 6, and replaced it with `@Convert` or `@JdbcTypeCode` to achieve the same functionality.
- Updated `@Type(type = "yes_no")` to use a different approach, as this annotation is removed in Hibernate 6.

Changes for General Improvements

- Simplified exception handling in `GlobalExceptionHandler` by removing redundant code and using a more concise approach.
- Updated `JwtAuthenticationEntryPoint` to use `jakarta.servlet.http` instead of `javax.servlet.http` to ensure compatibility with Spring Boot 3.
- Removed unnecessary code and imports in `SecurityConfig` to improve readability and maintainability.
- Updated `SecurityConfig` to use `@EnableMethodSecurity` instead of `@EnableGlobalMethodSecurity` to enable method security in Spring Security.

Key Changes

- **Namespace changes:** Replaced `javax` with `jakarta` in import statements to ensure compatibility with Spring Boot 3.
- **Security configuration updates:** Updated `WebSecurityConfigurerAdapter` to use `SecurityFilterChain` bean, and replaced `@EnableGlobalMethodSecurity` with `@EnableMethodSecurity`.
- **Hibernate updates:** Removed `@Type` annotation and replaced it with `@Convert` or `@JdbcTypeCode` to achieve the same functionality in Hibernate 6.
- **Exception handling improvements:** Simplified exception handling in `GlobalExceptionHandler` by removing redundant code and using a more concise approach.
- **Code refactoring:** Removed unnecessary code and imports in `SecurityConfig` to improve readability and maintainability.
